## BACK LOT STUNT COASTER

The station height is near ground level. The vehicles accelerate out of the station and immediately enter an upward, right turning 540° spiral. Upon exiting the spiral the train drops into a series of quick left and right turns. After the turns, the train enters a tight banked left turn and then goes through two camel humps where guests experience a near zero G effect. The train goes through a quick banked turn and drops through a stair effect. After a quick left turn the train goes up a ramp structure, comes to a stop for a show effect, and then is accelerated down a drop through a series of banked turns and finally drops down into a water effect where the train slows until it reaches the unload position.
